1. Introduction

The office staff found the efficient workflow difficult to justify until the official affluent donors reviewed the findings. Idiopathic pulmonary fibrosis is a chronic, progressive lung disease; pneumonoultramicroscopicsilicovolcanoconiosis is a famously long word, and electroencephalographically unrelated terms such as counterintuitively, uncharacteristically and incomprehensibilities appear here to force line-wrap hyphenation at the margins. Pre- and post-operative care, a state-of-the-art device, and a well-known "quoted phrase" — set off by an em-dash — all appear so that selection tests see real compound hyphens, quotes and dashes.

2. Method

Let $x^2 + y^2 = z^2$ hold [12]. See https://example.org/a/b?c=d&e=f for details; the p-value was < 0.05 (95% CI 1.2–3.4).

```
for (int i = 0; i < n; ++i) {
  total += weights[i] * samples[i];
}
```

Cohort	n	Mean
Control	120	3.4
